PROBLEM

Screen for a visually impaired

Better AR interactivity

AR contact lenses

Embed lens into a contact

Field of vision display

Eye tracking and motion checking

SOLUTION

Technology

- A tiny microLED display the size of a grain of sand to share critical information.
- Smart sensors powered by solid-state batteries built into a scleral lens that also corrects your vision.
- The lenses are ringed with electronics, including a camera that captures the outside world.

Technology

- A computer chip processes the imagery, controls the display and communicates wirelessly to external devices like a phone.
- A motion tracker that compensates for your eye's movement.
- The device is powered by a battery that's charged wirelessly overnight, like a smartwatch.

Safety

- Mojo Vision is conducting safety testing and clinical trials to ensure Mojo Lens is safe for use and meets rigorous safety standards.
- Mojo Lens is designed to be powered by a small, wireless battery that is safe and unobtrusive.
- Regulatory approval is necessary to ensure the safety, effectiveness, and quality of medical devices like Mojo Lens, which is regulated by the FDA in the US.
- Regulatory approval helps protect public health and safety, ensures strict quality standards, and prevents fraudulent or misleading claims about the safety and efficacy of medical devices.
